

My Experience Building a Website

Last week, I worked on a major assignment for my vocational subject. I was tasked with creating a personal portfolio landing page. I used HTML as the basic framework and Tailwind CSS to enhance its visual appearance.

I started the project with great enthusiasm. On the first day, I successfully built the basic structure and a modern-looking navigation bar. However, by the second day, challenges began to arise when I tried to make the gallery section look neat on various screen sizes.

The main difficulty I faced was managing responsiveness. While the layout looked perfect on a laptop, the image arrangement became messy when viewed on a mobile phone. I spent hours trying to understand how grid systems and breakpoints work so that the layout could adapt automatically.

Another exhausting problem occurred when my code suddenly "broke". The website, which was previously colorful, suddenly turned into plain text without any styling. After tracing the code line by line for nearly two hours, I discovered that the culprit was just a simple typo in the configuration file and a missing `</div>` closing tag. It felt very draining just because of one single wrong character.

Finally, after going through a long debugging process, my website was completed on time and looked very professional. Although the process was full of challenges and minor frustrations, I learned a lot about patience and attention to detail. This experience made me realize that in coding, even the smallest mistake matters, but the satisfaction of seeing the final result is definitely worth the effort.
